Smart crowdsourced testing

What is the www.crowdtesting.network ?

We are a crowdsourced testing platform built by very experienced software quality assurance professionals. Our platform allows comprehensive and sequential testing of your **online shop**, **portal**, **app**, **game**, **TV/set-top box** etc.

Our special features differentiate us from other crowdsourced testing platforms: with us you schedule your testing sessions, create test plans, build virtual teams, let testers write *cucumber* scripts and many others.

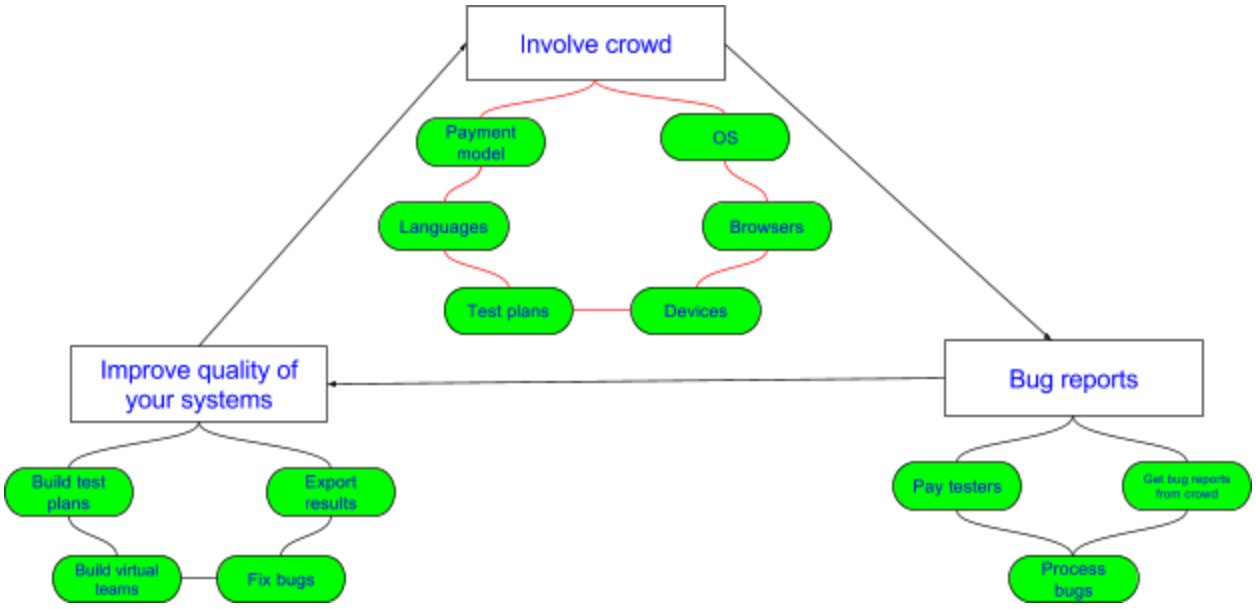
The work is executed by testing professionals with any experience background you require, covering practically every combination of devices, operating systems and browsers. Our crowd testers use their own devices to test your systems over the internet and you pay them only for bugs they find, not for time they spend testing.

You choose whether you orchestrate the testing effort of tens, hundreds or even thousands of testers using our easy-to-use online tools or we dedicate a highly professional manager to operate your project and provide you a report, containing problems, found by our testers.

The www.crowdtesting.network workflow

We help you keep focus on your system-under-test by providing special features, which get you quick to results and let you easily overview quality situation of your soft.

Following is our workflow:



One of our main goals is to reduce *your* effort related to using our system, therefore we've built a special set of tools, which simplify your work. For example, if you work, in SCRUM project management framework, your sprint velocity will even increase.

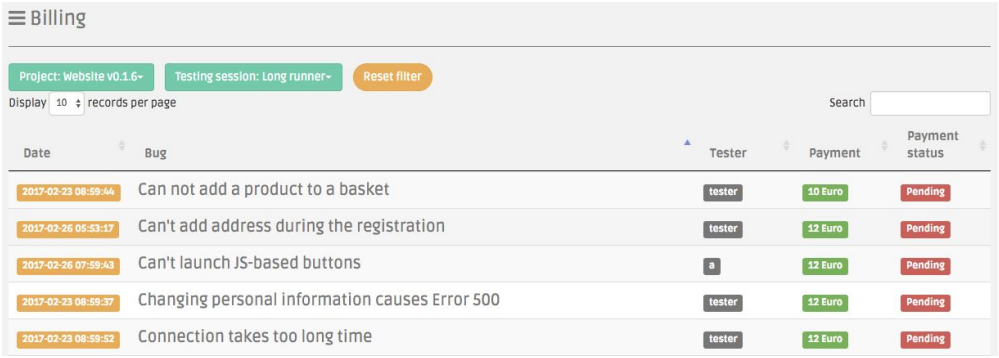
Billing



Types of testing

Our crowd testers can test **functionality**, **security**, **performance**, **localization**, **user experience, accessibility** and more. They can execute step-by-step manual tests, write *cucumber* procedures or even write automated tests using Java, Ruby and other programming languages.

Service types

Following service types are available:

Self service	You orchestrate the whole crowdsourced testing activities, including: test initiation, bugs processing, communication with crowd testers in case more details needed. As well, you build your test plans and virtual teams.
Managed service	We learn your requirements and goals and assign a dedicated project manager, which will organize the whole work with crowd testers, get and process their feedback and provide you detailed bug reports, which, on demand, can be proved and reproduced by our specialists before sending them for your consideration.
Inhouse service	In some cases you may require special testing setups or configurations, which you'd prefer to be done by our in-house specialists.
Complete service	You may combine crowd testing activities with our in-house service, for example, in case you need crowd to test your features and our specialists to test your systems' performance.

Cooperation models

There are several cooperation models:

Regression Tests	You set up crowd tests periodically, eg., as you release a new version, introduce a new feature, upload a hotfix to your production server and so on.
Service Subscription	You pay a monthly subscription fee and get all the features in our platform for an unlimited usage. An advantage of a subscription is that you can test every small change in your application and still keep effort related to managing crowd testing activities on a very low level.
Long runners	Let your productive systems to be under watch of our crowd testers. There will be anytime some testers exploring your shop, using your app, playing your game etc., and in case they find something - they will report you, unlike your visitors or clients, which will just leave your app or site if they face a bug - without even letting you know they've experienced it

Additional cooperation models are available on demand.

Let's talk

Let us contact you to understand your needs and requirements and we will come up with creative ideas of how we and our crowd testers can help you improve quality of your systems and provide better solutions and service to your clients.

We have a lot of experience in software quality assurance and we know how to help you deliver best quality.
