

Let me say welcome to all of you! Today I will be telling you about one small but profitable thing that can and will change the mobile market! How? You will see!

I am here to give you an offer. I have an issued patent and WIPO application (not published yet), which has passed an international search through RUPTO (Russian patent database internal search), USPTO (United States Patent and Trademark Office database), PAJ (Database of Patent Abstracts of Japan), Esp@cenet (European Patent office database) and Information Retrieval System of FIPS (as Russian receiving office was an International Search Authority). Thus, I can say, that item which I offer is new and

Nowadays all manufacturers of smartphones and its parts are interested in one competition – to make known parts better. Like better camera, better screen, better processing unit, etc. However, none is implementing something fundamentally new in their products! And this is what I want to offer you – make and implement a new function and new thing in your mobile devices!

What can it be? It is simple! I am sure that you all know about different disasters (avalanches, tsunamis, hurricanes, earthquakes, etc), which happen from time to time around the Globe, somewhere more often, somewhere less. This is something that happens unexpectedly for people, who are in an area of disaster. And those people better to be prepared, don't you think? I am offering a small self-sufficient unit, which is built in a mobile phone or a smartphone. This small unit will facilitate a Search and Rescue operations on field of disaster and therefore will help to save precious human lives. It is really new feature for mobile devices - to save lives!

For the financial aspect, everything is easy and straight – as soon as first company implements something new in its product, the competitors will start implementing as well. As you all well know, the development of mobile devices is very fast and quick – for the last 20 years we made a way from button-type phones (with one function – phone) to the smartphones, with touchscreen, Wi-Fi, Bluetooth, 20+MP camera, fingerprint sensor, electronic gyroscope, etc. Moreover, we always can find out who was the first who implemented such a things in their devices!

Those who will be first will be the leader and pioneer in a new field of providing security to their customers through their products.

There are more than 1.5 billion smartphones sold to end user every year! This are cheap and expensive ones, well-known and little-known models and brands. These devices are used all over the world - no matter climate or government situation! Yes, nowadays everybody has a mobile phone! And how many users are in area of possible disasters? How many governments are interested in providing extra security to their citizens? I know, that there is a company, which developed a search beacon for its clients in Asia! Moreover – this company is an Insurance Company! Do you see the field of possible customers?! And only manufacturers of mobile phones and smartphones misses this field!

By the way, I need to make a small note – not only manufacturers of smartphones can have a profit, but also a manufacturers of smartphone's parts! I am sure you all know that manufacturer of smartphone and manufacturer of smartphone's parts are very often two different companies!

With current market state and competition on market of mobile devices, with current technology level and with current production capacity the first serial smartphone will be presented to wide public next winter. It is very fast! The income will be generated through selling and implementing of unit into mobile devices not only one manufacturer, but also other interested parties! Later on the governments will be forcing manufacturers of mobile phones to have the unit built in their devices because local Search and Rescue forces will be using devices in cases of disasters! Thus, spread of implementation of mentioned unit will cover Asia and Oceania in one or two years – and this is more than 300 million smartphone sales a year! Further to cover all over the World!

The profit will be gathered not only from manufacturing, implementing and selling unit inside a mobile devices to end user, but also as a licensing of other manufacturers to produce the unit based on the patent. Moreover, the PCT application has not been published yet and can remain unpublished for some time becoming a “secret”! Also it gives a wide range of countries, where the patent can be granted. As the international search has been carried out I can say, that half way is already passed!

As a summary, we have on hands to offer you:

Patent and PCT application, which have passed International Search so it is half an issued patent in more than 150 contracting states;

A new niche in providing safety for mobile device users;

Opportunity to develop and produce fundamentally new feature in a smartphone field;

Government support for zones of possible disaster danger;

Great possibility to take an indirect participation in Search and Rescue operations and save precious human lives!

...

This is a small investment, which in due course will bring a great profit and gratitude of public in future!

Thank you for your attention! If you have any questions, I will be glad to answer all of them!
